

Ninth Lecture

Stagflation

Differential accumulation (revision)

- Breadth and depth once more
- Internal vs. external depth

Internal depth

- Differential efficiency?
- Differential input prices?
- Running on empty: “meeting the average”

External depth

- “Inflation is always an everywhere a distributional phenomenon”
- Differential inflation
- Differential stagflation

History and theory

- “Price revolutions”
- The 20th century: the rise of organized power and staglatory accumulation
- The centennial theory/reality fracture
- “Stagflation” and structure”, or “stagflation as restructuring”?
- Stagflation as an “anomaly”: explaining stagflation with power
- Stagflation as the “normal”: explaining power with stagflation

The conventional creed

- The “classical dichotomy”
- Liquidity
- Excess demand, deficient supply

Keynesianism

- The Phillips Curve
- Lipsey’s “general theory”
- Samuelson and Solow’s modification: from wages to prices
- “We are all Keynesians”
- A “menu of choices” and Kalecki’s political “business cycle”
- Eating the cake and having it, too: power without redistribution

Monetarism

- Expectations: economic agents strike back
- Friedman and Phelps: Adaptive expectations
- How long is the “short run”?
- What is the “normal rate of unemployment”?
- Rational expectations: subjective and objective probabilities
- Muth, Sargent and Lucas: the collective economist as God
- *Laissez faire*, once more
- Expectations: from Keynes’ uncertainty to the New Classicists’ probability
- The “science” of the Phillips Curve, or “can theory ever be wrong?”

Supply shocks

- Stagflation: an upward sloping Phillips Curve?
- The postmodern “other”: blame it on the oil sheiks, the weather and the workers
- Oil sheiks and the whether: do raw material prices cause inflation?
- Do workers cause inflation?
- “Wage push” or “profit push”?
- “Markup inflation” and “barriers to entry”

Inflation and redistribution

- Barking up the wrong tree
- Inflation as restructuring
- Where is politics?
- Redistribution: capitalists contra workers
- Redistribution: large vs. small firms
- Why stagflation – “return” and “risk”

Regimes of differential accumulation

- The pendulum of breadth and depth

Differential Earnings

$$earnings_D \equiv employment_D \times earnings\ per\ employees_D$$

Table 1
Regimes of Differential Accumulation

	<i>External</i>	<i>Internal</i>
<i>Breadth</i>	Green-field	Mergers & Acquisitions
<i>Depth</i>	Stagflation	Cost-cutting

FIGURE 1 U.S. Accumulation: Internal vs. External Breadth

NOTE: Indicator is based on splicing of separate series.

“Running on empty”

“How do you build a company, when your buyers are infinitely knowledgeable and where your suppliers maintain a level playing field for your competitors? What remains your competitive differentiator or your source of value or whatever academic cliché you want to wrap around it?”

Andrew Grove, Chairman of Intel. Cited in Byrne, John A. 2000. Visionary vs. Visionary. *Business Week*, August 28, pp. 210-212.

FIGURE 2 Consumer Prices in the U.K.

The neutrality of money

“There cannot, in short, be intrinsically a more insignificant thing, in the economy of society, than money.”

John Stuart Mill

“Money is a veil.”

Irving Fisher

“Money is neutral, a veil with no consequences for real economic magnitudes.”.

Franco Modigliani

“Inflation is always and everywhere a monetary phenomenon.”

Milton Friedman

The quantity theory of money

[P = prices, T = transactions, M = money, V = velocity, Q = output; lower case variables represent rates of change]

1. $P * T \equiv M * V$
2. $P \equiv M * V / T$
3. $p \approx m + v - t$
4. $p \approx m - t \quad ; v = 0$
5. $p \approx m - q \quad ; t = q$

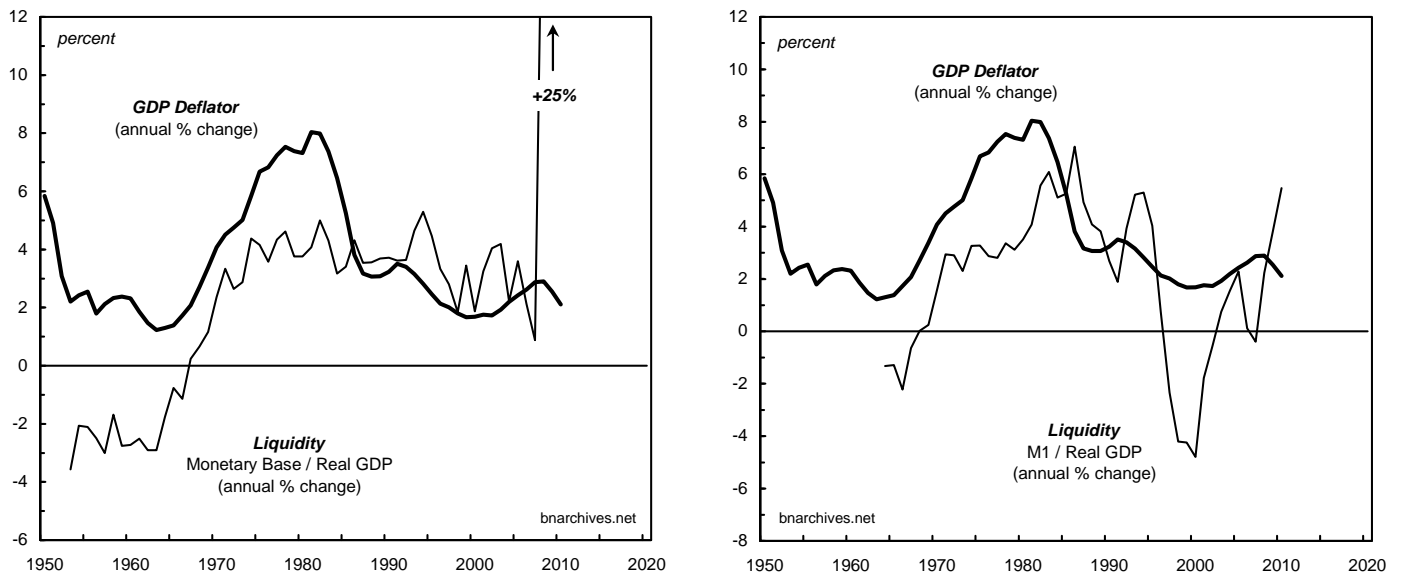

FIGURE 6 United States: Liquidity and inflation

NOTE: Annual data smoothed as 5-year moving averages. Last data points are for 2010.

SOURCE: IMF.

FIGURE 7 The Phillips Curve

SOURCE: Phillips, A. W. 1958. The Relation Between Unemployment and the Rate of Change of Money Wages in the United Kingdom, 1861-1957. *Economica* New Series 25 (100, November): 283-299

From wage inflation to price inflation

W is the wage rate, U is the rate of unemployment, P is the price level, Q is output per worker (labour productivity), K is the markup, and lower-case variables denote corresponding rates of change.

$$1. \quad w = f(U)$$

$$2. \quad P = (1 + K) \frac{W}{Q}$$

$$3. \quad p = \left(1 + \dot{K}\right) + w - q$$

If the markup is fixed, we have,

$$4. \quad w = p + q$$

Substituting into equation 1:

$$5. \quad p = f(U) - q$$

Cost push and the end of perfect competition

“Some holders of this view [cost push] attribute the push to wage boosts engineered unilaterally by strong unions. But others give as much or more weight to the co-operative action of all sellers –organized and unorganized labor, semimonopolistic managements, oligopolistic sellers in imperfect commodity markets – who raise prices and costs in an attempt by each to maintain or raise his share of national income, and who among themselves, by trying to get more than 100 per cent of the available output, create ‘seller’s inflation . . . to explain possible cost-push inflation, it would seem more economical from the very beginning to recognize that imperfect competition is the essence of the problem and drop the perfect competition assumptions.”

Samuelson, Paul A., and Robert M. Solow. 1960. Problem of Achieving and Maintaining a Stable Price Level: Analytical Aspects of Anti-Inflation Policy. *The American Economic Review* 50 (2. May): 177-194

“Expectations Augmented Phillips Curve”

$$p_t = f_1(U_t) + p_t^e$$

$$p_t^e = f_2(p_t)$$

Rational Expectations

“ . . . expectations of firms (or, more generally, the subjective probability distribution of outcomes) tend to be distributed, for the same information set, about the prediction of the theory (or the ‘objective’ probability distributions of outcomes).”

Muth, John F. 1961. Rational Expectations and the Theory of Price Movements. *Econometrica* 29 (3, July): 315-335.

“ . . . expectations of inflation are assumed to be endogenous to the system in a very particular way: they are assumed to be ‘rational’ in Muth’s sense – which is to say that the public’s expectations are not systematically worse than the predictions of economic models. This amounts to supposing that the public expectations depend, in the proper way, on the things that economic theory says they ought to.”

Sargent, Thomas J. 1973. Rational Expectations, the Real Rate of Interest, and the Natural Rate of Unemployment. *Brookings Papers on Economic Activity* (2): 429-472.

$$p_t^e = E(p_t | I_{t-1})$$

$$p_t = E(p_t | I_{t-1}) + u_t$$

$$p_t - p_t^e = u_t$$

General Government Final Consumption Expenditure (% of GDP)

NOTE: Cutoff point between Middle and High Income countries: \$12,276 Gross National Income per Capita in 2010 (using the World Bank Atlas Method).

Original Phillips Curve?

Adaptive Expectations?

Rational Expectations?

Supply Shocks: The Usual Suspects

“A clear and central villain of the piece is the historically unprecedented rise in commodity prices (mainly food and oil) in 1973-74 and again in 1979-80 that not coincidentally accompanied the two great burst of stagflation.

“. . . one of the variables that set the stage for the 1970s stagflation was the rise in union power and militancy at the end of the 1960s. . . . A real wage boom resulted, which started a squeeze on profits even before 1973. . . . It strikes us as misguided to consider the labor market as a perfectly competitive bourse when in almost every OECD economy much of the labor force is unionized and governments play an enormous role in affecting labour compensation.”

Bruno, Michael, and Jeffrey Sachs. 1985. *Economics of Worldwide Stagflation*. Cambridge, Mass.: Harvard University Press, p. 7

Supply Shocks: The Cruel Dilemmas

“The limited capability of policy to influence supply poses a particularly vexing problem in a stagflationary world since any stabilization policy adopted in response to stagflation is bound to aggravate one of the problems [inflation or unemployment] even as it helps cure the other. Such is the policy dilemma of stagflation.”

Blinder, Alan S. 1979. *Economic Policy and the Great Stagflation*. New York: Academic Press, pp 20-21.

FIGURE 8 World prices

Original data are from IMF International Financial Statistics through Global Insight (series codes: L64@C001 for the CPI; L76AA&D@C001 for crude petroleum; L76EX&D@C001 for food). The last data points are for 2010.

FIGURE 9 Inflation and the Wage Share in the United States

SOURCE: U.S. Bureau of Economic Analysis. Last data points are for 2010.

FIGURE 10 Inflation and the Wage Share in Israel

SOURCE: Jonathan Nitzan and Shimshon Bichler, *The Global Political Economy of Israel* (London: Pluto Press, 2002), Figure 4.7, p. 157. Original data from Bank of Israel. Israel Central Bureau of Statistics

Wage push or profit push?

Price = Unit Wage + Unit Profit

$$P = W + \Pi$$

$$P = (1+K) * W \quad \text{where } K = \Pi/W$$

- “Wage push” inflation can occur only if K is fixed.
- If K is fixed, the rates of change of profit and of wages are the same.
- If the two rates of change are the same, “wage push” inflation must also be “profit push” inflation.

FIGURE 11 U.S. Inflation and Capital-Labour Redistribution

* Corporate earnings per share are for the S&P 500. The wage rate is the average hourly earnings in the goods producing private sector till 1963 and in the private sector afterwards.

NOTE: Series are expressed as 3-years moving averages. Last data points are for 2011.

SOURCE: Updated from Jonathan Nitzan and Shimshon Bichler, *Capital as Power: A Study of Order and Creorder* (New York and London: Routledge, 2009), Figure 16.2 p. 371. Original data from Standard & Poor's through Global Insight (series code: EARN500NS for S&P 500 earnings per share); U.S. Department of Commerce and U.S. Bureau of Labor Statistics through Global Insight (series codes: AHPGP and AHPEAP for the wage rate; WPINS for the wholesale price index).

SOURCE: Nitzan, Jonathan, and Shimshon Bichler. 2006. [Cheap Wars](#). *Tikkun*, August, 9.

FIGURE 13 U.S. Inflation and Differential Accumulation

* The markup is the per cent of net profit in sales. The Fortune 500 markup is the per cent of after tax profit in sales revenues. The business sector markup is computed by dividing total corporate profit after tax with IVA and CCA (from the national income accounts) by total business receipts (from the IRS). The Differential Markup is given by dividing the Fortune 500 markup by the business sector markup.

NOTE: Until 1993, the Fortune 500 list included only industrial corporations (firms deriving at least half their sales revenues from manufacturing or mining). From 1994 onward, the list includes all corporations. For 1992-3, data for Fortune 500 companies are reported without SFAS 106 special charges.
